Waveform – to allow the streaming of an external text test file (i.e. FUDS drive cycle test) to the test system.

Time Minimum step time should be 10ms

Control Measurement and Adjustment every 10ms

Cell holders for Coin 2032, 18650, Pouch

Test system's software with capability to terminate a particular channel's test and force an open circuit condition to isolate the device under test based on user defined safety (upper and lower) tolerances of voltage and current.

Step types with Charge (Source Current), Discharge (Sink Current), Rest (Wait), Voltage Scan, Pulse – 10 mS standard (GSM, CDMA, and 1 mS channels with 100 μS pulse widths should be possible as upgrade)

Steps to be user programmed to operate in modes of constant (fixed) current, power, voltage, or resistance

Each test step with at-least 16 different end conditions

Tests- branch to any step in the test based on the step end criteria met

Step end conditions should include measured values (voltage, current, time, etc.), integrated values (energy, capacity, half cycle data), and calculated values ($\Delta V/\delta t$, $\Delta T/\delta t$, first and second derivatives).

Four levels of loop nesting must be available in each test

Test procedures should be able to be called as a subroutine in another test for yielding limitless step lengths

Software program on channel to extract 1 kHz AC impedance during testing

Data from active (real-time) or completed tests must be viewed, plotted, or printed.

The system must be supplied with separate data analysis software package to provide plotting of test data including statistics.

The system must be supplied with separate data backup software to include calibration data, test data and system configuration data.

Software must be included to allow for automatic transfer of test data via a institutes's LAN to a central location

Charts (plots) must be able to be customized with titles, axis formatting, line colors, and much more.

Customized charts must be able to be saved as templates to use again and again.

Data from multiple test channels should be able to be plotted on a single chart, or multiple charts must be created as a single view.

Safety Isolation relays to be built in every test channel to physically disconnect battery from charging circuit in the event of a safety condition violation

The system must include dedicated power monitoring electronics to provide complete data retention and automatic restart from external power failures when used with an uninterruptible power supply

System should include PC and Battery Interface connectors

Test systems must be delivered already factory calibrated to NIST traceable standards, and require calibration only once per year.

The test cabinet must be designed with front and rear doors providing easy access to the electronics for maintenance

Option

Temperature Chamber

The system must support several types of environmental chambers that may be added in the future. This facility must allow for tests started with single or groups of cells, output a temperature set point to the environmental chamber(s) configured in the system software throughout the test. With the appropriate interface hardware the system should communicate with one or several chambers.

Thermocouple Inputs to integrate with 32 channels

to obtain a historical record of temperature and Temperature functions to be used to control tests performed on channels with thermocouple inputs on the basis of absolute temperature, $\Delta T/\delta t$, ΔT , and several others. Sensors of Type K, T, or J to be included
